

Every grant should earn its payout.

Community preference becomes transparent,
milestone-controlled funding on Stellar Testnet.

Signal → Fund → Prove → Approve → Payout

Community funding loses trust between promise and payout.

01

Priority is noisy

Votes, chats, and donor intent live in different tools, so the strongest signal is hard to preserve.

02

Progress is opaque

Updates arrive as links and screenshots without a durable chain from milestone to decision.

03

Payout is binary

Funds often move upfront or remain stuck while contributors debate whether the work is complete.

The product opportunity is not another donation page—it is a shared, inspectable decision trail.

One public workflow connects the crowd's signal to the payout rule.

01 Choose

One wallet records one category preference on-chain.

02 Fund

Contributors deposit Testnet XLM into project escrow.

03 Verify

Evidence, reviewers, contributor votes, and contract thresholds control release.

What the user sees

**A guided action,
a confirmed receipt,
and a public proof link.**

The frontend guides. The wallet authorizes. The contracts decide.

Five on-chain stages make the decision trail inspectable.

Every successful action ends with an RPC-confirmed transaction hash and Stellar Expert route.

The product already spans signal, grant, and proof-to-payout flows.

Signals

Proof

390px

Public Testnet interface with real contract addresses, wallet signatures, responsive layouts, and Explorer evidence.

Proof exists today; Level 5 adds scale—not fabricated traction.

10

independent Level 4 users

10

unique successful votes

0

verification failures

LEVEL 5 COHORT

0 / 50 qualified new participants

Pending authentic recruitment, consented Forms, and verified transactions.

Feedback is now a release gate, not a collection of anecdotes.

Already shipped

Guided roles · wallet readiness · Friendbot funding · confirmed proof handoff · aggregate funnel events

Unlocks after Wave 1 and Wave 2

Two Level 5 feedback-derived releases with direct Git commit links and measured before/after results.

The wedge sits where development funding, diaspora flows, and transparent rails meet.

\$4T

annual SDG financing gap

developing countries · UN 2026

\$685B

remittances to LMICs

2024 estimate · World Bank

\$55.6B

Stellar payment volume

2025 · Stellar Development Foundation

These figures establish context—not Starpost revenue or a claimed TAM. The initial market remains community-scale Testnet coordination.

Financial authority stays on Stellar; growth services observe and guide.

Payout authority stays on-chain; the growth layer cannot move funds.

Wallet authorization

Users review and sign; no recovery phrase or secret key enters the frontend.

Confirmed state

Simulation and submission are not shown as success until RPC returns SUCCESS.

Role separation

Reviewer, arbitrator, creator, and contributor rules prevent one UI path from bypassing policy.

Exact accounting

Escrow releases only the approved milestone amount and preserves terminal refund paths.

RESIDUAL RISK · Testnet only · no independent audit · TTL and public-wallet privacy require active operations

Three waves turn onboarding data into two measurable product releases.

WAVE 1

10 users

Fix every transaction blocker + most repeated usability problem

WAVE 2

20 users

Compare funnel and ratings + ship the second priority request

WAVE 3

20 users

Validate the final release + close evidence collection

RETENTION CHECK

Measure distinct repeat activity after seven days; report the real result even when it is zero.

Help Starpost prove 50 real people can coordinate one transparent grant.

01

Recruit

Community and NGO testers across four roles

02

Validate

Two authentic feedback releases and seven-day repeat activity

03

Expose

Ecosystem demos, pilot partners, and an independent security review
